

How to build-in FFmpeg

1. Add `LICENSE_FLAGS_WHITELIST="commercial"` to the tail of `meta/base/conf/mt8516/aud8516*-slc/local.conf.sample`

2. clean build:

```
rm -rf build sstate-cache
```

```
export ***
```

```
source ***
```

```
bitbake ***
```

will trigger FFmpeg download and compile.

Can find it under `/build/tmp/work/aarch64-poky-linux/ffmpeg`
