Assistant Stub Intro

Presenter: Pingan.Liu

Department: MSZ_HSD_SW9_SS3

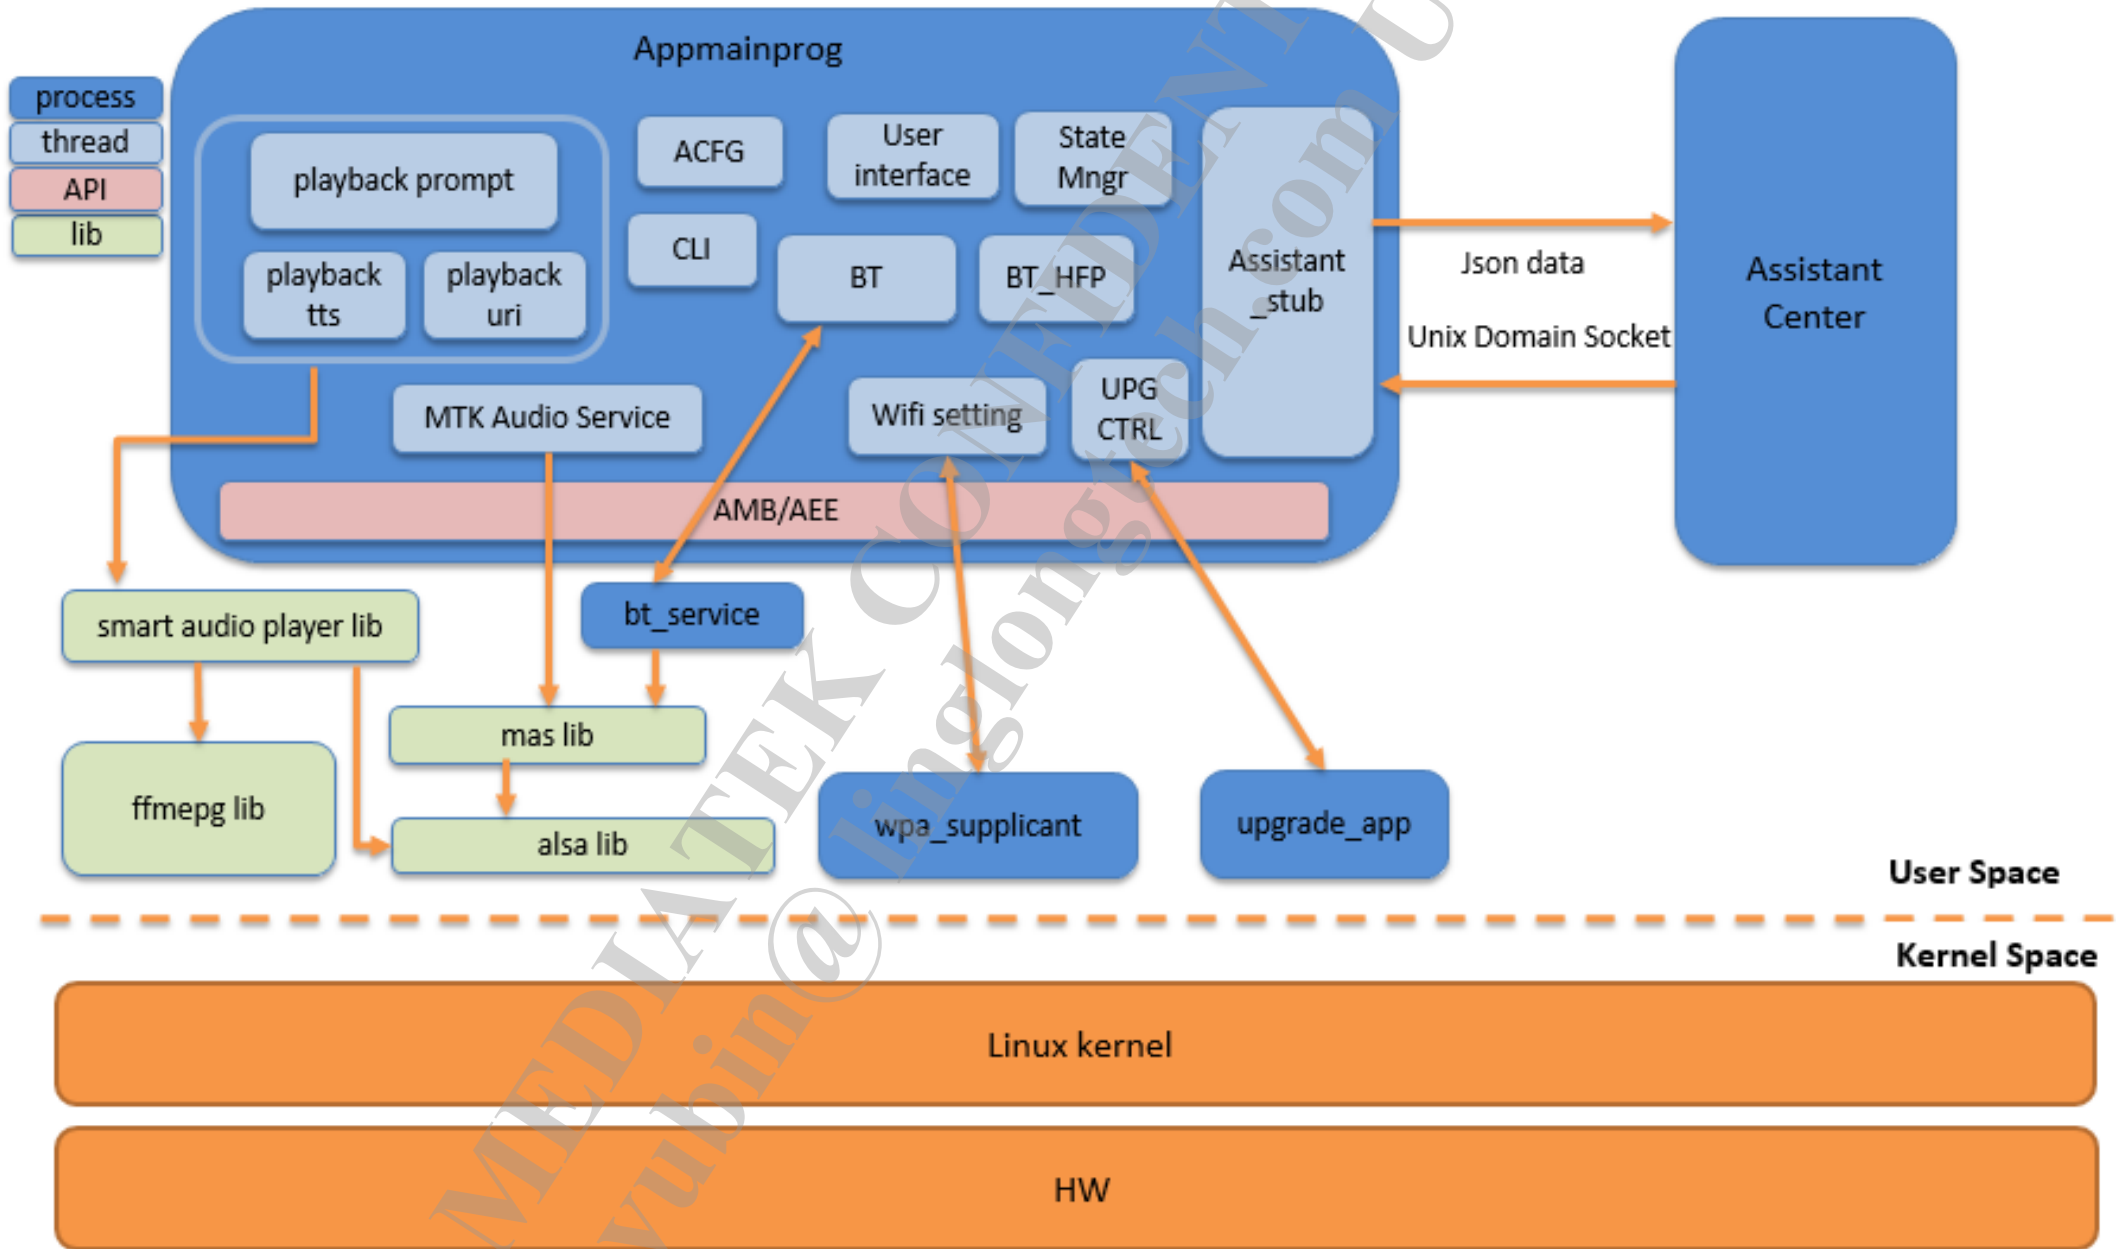

Agenda

- MT8516 Software Architecture
- App Feature Introduction
- Code Introduction
- Q&A

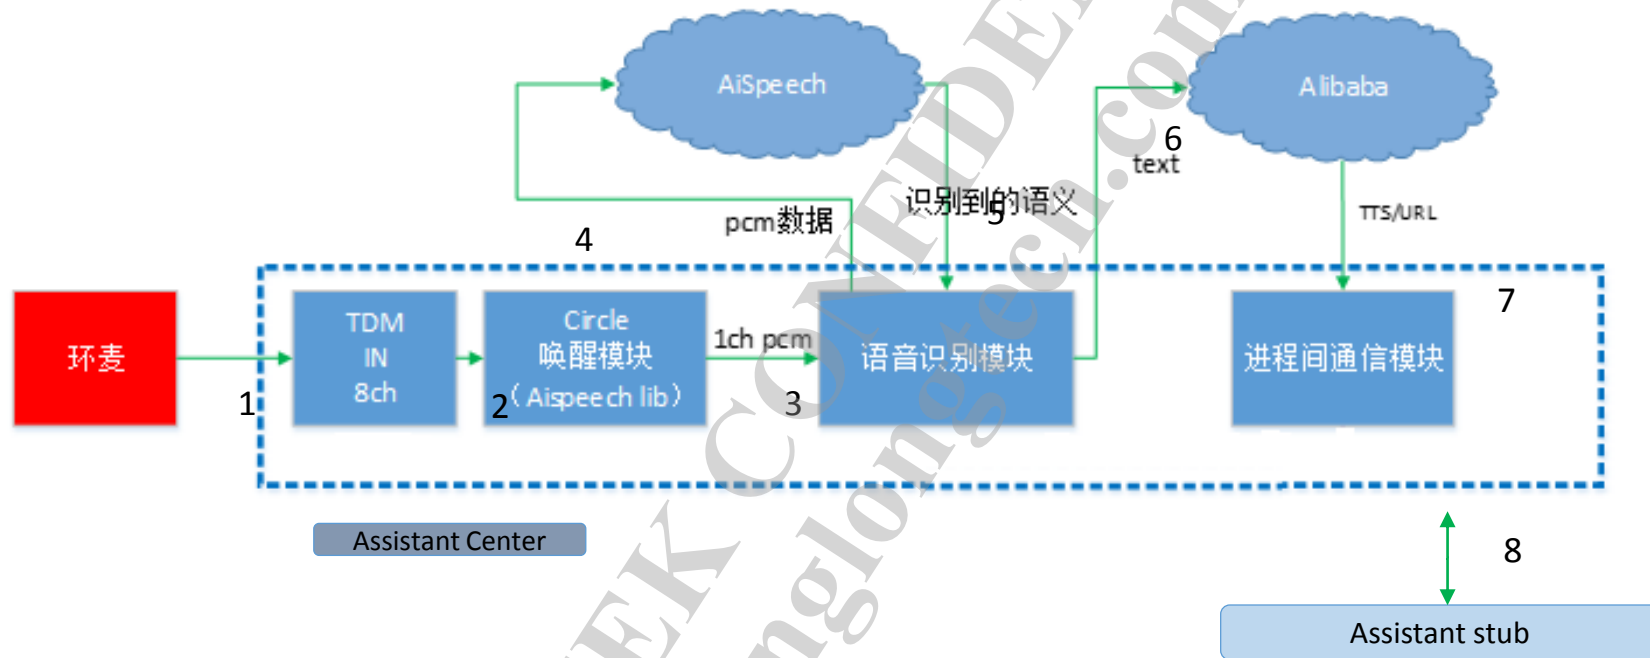

MEDIA TEK CONFIDENTIAL
yubin@linglongtech.com USE

MT8516 Software Architecture

App Feature Introduce

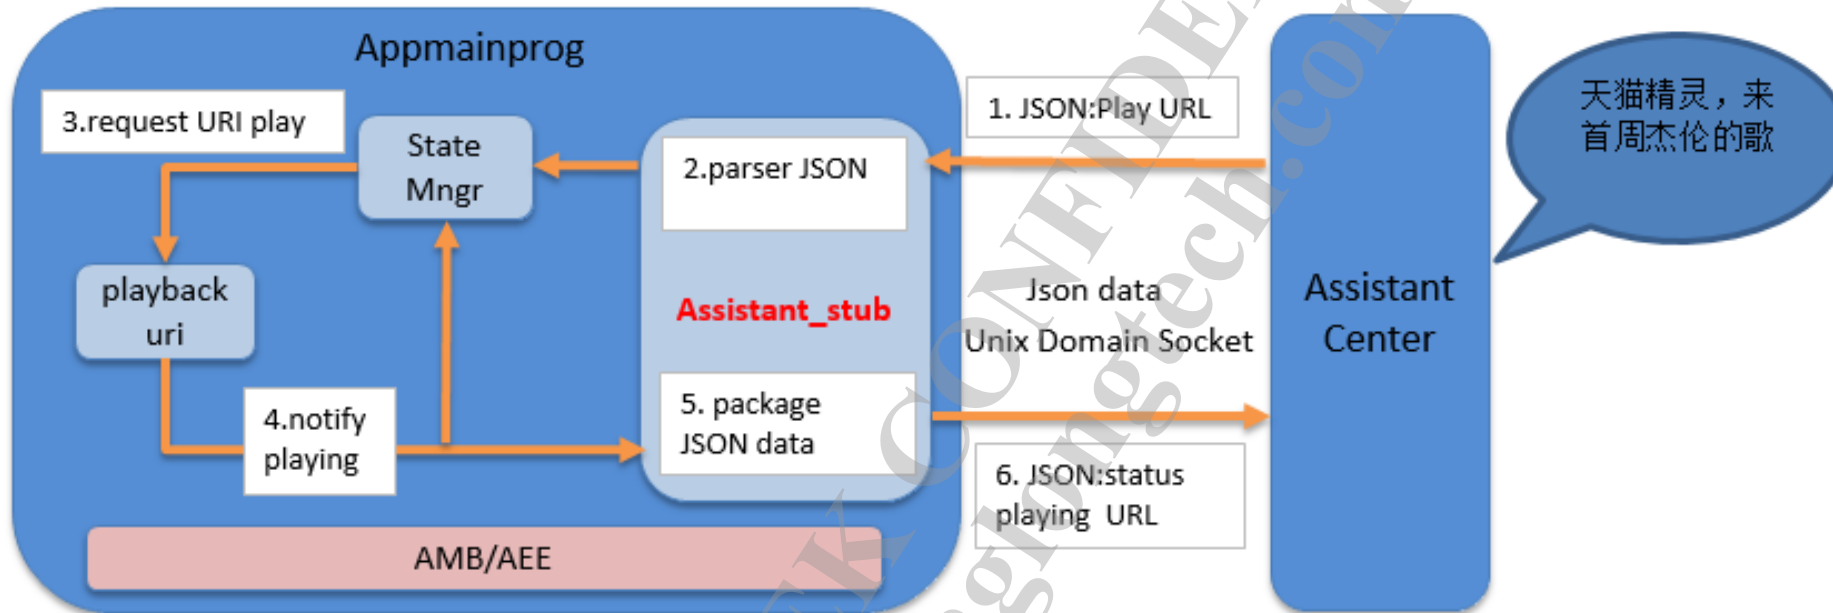

- Assistant Center Process

- Step 1: 通过alsa lib read 8路TDM in音频
- Step 2: 唤醒模块识别主要是将8路PCM数据合成1路
- Step 4/5: 语义识别模块将合成的1路PCM数据送往Aispeech语端，作用是将音频识别成字符串并返回
- Step 6/7: 将识别后的字符串以文本方式上传给客户服务器，并由客户服务器理解并转换成最终要平台端播放tts或者url或者是本地提示音prompt
- Step 8: 将识别后的语义命令通过json格式打包并发往appmainprog的assistant stub 接收线程

App Feature Introduce

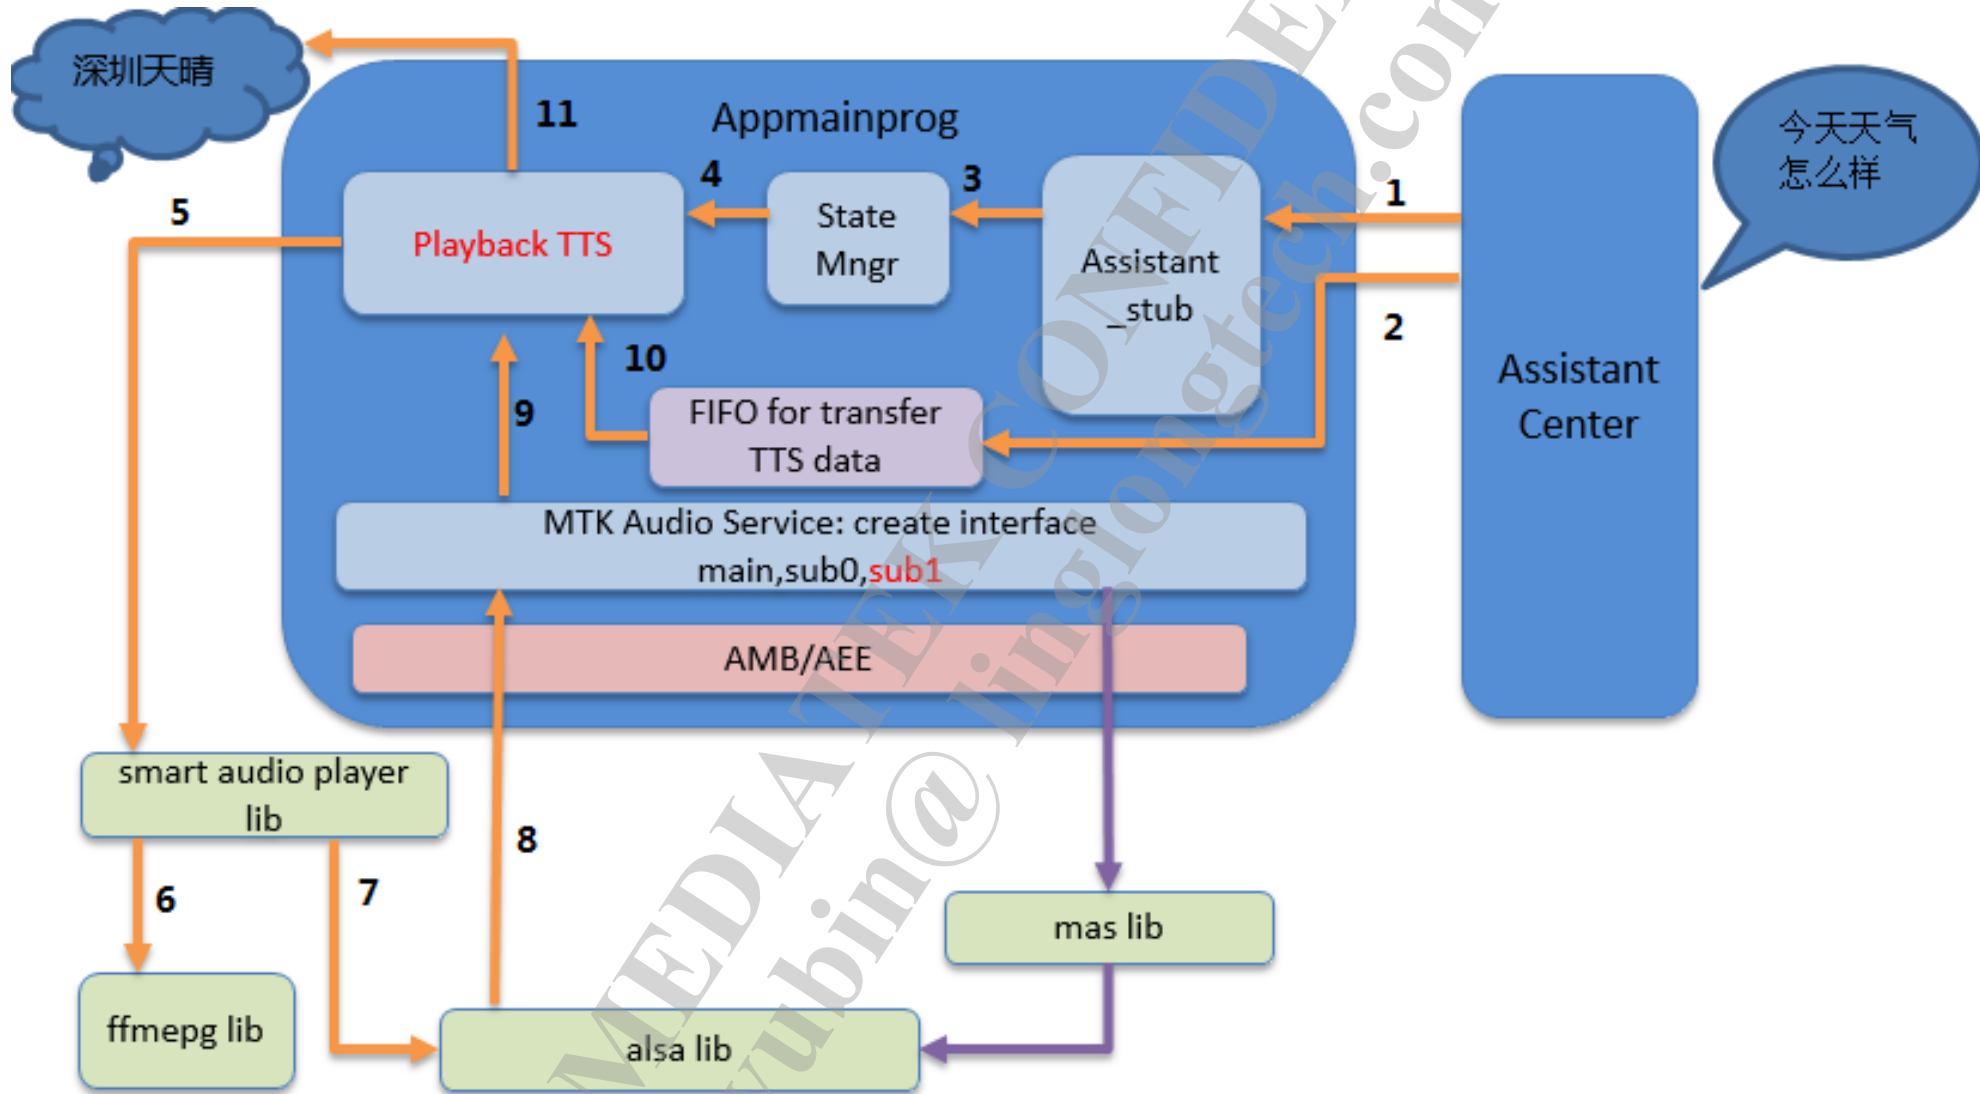

- Assistant Stub

- Step 1: Assistant center模块收到语音并转化为播放URL的请求，接着将请求按一定格式封装成JSON数据，并通过socket方式发送数据
- Step 2: Assistant_stub线程会通过socket方式接收数据并解析JSON，然后将播放请求发给State_Mngr模块
- Step 3: State_Mngr模块会判断当前是否有source在播放，如果有则暂停当前播放，接着发送request请求至playback_url app
- Step 4: playback url app收到播放请求后，会根据url去播放，并将起播状态同时通知给到state_mngr以及assistant_stub模块
- Step 5: 模块收到播放状态后，会按一定格式打包成JSON数据格式
- Step 6: 打包好后，通过socket发送至 assistant center

App Feature Introduce

- Playback -- TTS for example (Text to speak)

code Introduce

- assistant stub—register

```
00090: static APP_REG app_to_reg[] = {
00091:     {a_timerd_register, {0}, TIMERD_THREAD_NAME},
00092:     {a_acfg_register, {0}, ACFG_THREAD_NAME},
00093:     {a_sm_register, {0}, SM_THREAD_NAME},
00094:     {a_assistant_stub_register, {0}, ASSISTANT_STUB_THREAD_NAME},
00095:     {a_wifi_setting_register, {0}, WIFI_SETTING_THREAD_NAME},
